An inverse problem in science is the process of calculating from a set of observations the causal factors that produced them: for example, calculating an image in X-ray computed tomography, source reconstruction in acoustics, or calculating the density of the Earth from measurements of its gravity field. It is called an inverse problem because it starts with the effects and then calculates the ...

In electronics, an analog-to-digital converter (ADC, A/D, or A-to-D) is a system that converts an analog signal, such as a sound picked up by a microphone or light entering a digital camera, into a digital signal. An ADC may also provide an isolated measurement such as an electronic device that converts an input analog voltage or current to a digital number representing the magnitude of the ...

The number of sample is determined by using Slovin's formula with 95% confidence. Slovin's formula is used to get an appropriate number of samples taken from the population especially when the population is too large to study (Stephens, 1994). The researcher will make use of stratified sampling to select 368 students.

X. Yao, in International Encyclopedia of Human Geography, 2009 Spatial resolution. The spatial resolution of a georeferencing method is the size of the area covered by a single referent. A referent expressed as coordinate (x, y) is a point. Another referent '123 Main Street' pinpoints down to the footprint of a building, while 'metropolitan Atlanta' refers to a geographic area over 15 ...

Author summary Most metabolomics analyses rely upon matching observed fragmentation mass spectra to library spectra for structural annotation or compare spectra with each other through network analysis. As a key part of such processes, scoring functions are used to assess the similarity between pairs of fragment spectra. No studies have so far proposed scores fundamentally different to the ...

Author Summary Contemporary biology has largely become computational biology, whether it involves applying physical principles to simulate the motion of each atom in a piece of DNA, or using machine learning algorithms to integrate and mine 'omics' data across whole cells (or even entire ecosystems). The ability to design algorithms and program computers, even at a novice level, may be the ...
