Scientists call a plant's ability to bend toward light phototropism. Even as far back as ancient Greece it's been a big puzzle about how plants are able to do it. People experimented with how plants accomplish this amazing feat, but no one really figured out how it worked—until Charles Darwin came along, that is.

Phototropism Experiment - How Plants "See" Light

Phototropism in plants refers to the direction of plant growth in relation to a light source. Positive phototropism is growth towards a light source. Negative phototropism is growth away from light. These phenomena are easily observable through phototropism experiments that anybody can do.

When a seed germinates, the roots grow downward, and the stem grows upward. If you expose the growing stems to light from one direction, they start to grow in that direction. In 1809, Swiss botanist Augustin Pyrame de Candolle studied the growth of plants toward a light source and stated that it was caused by an unequal growth on only one part of the plant.

Science Experiment | Biology | Phototropism in Plants

One such response is the phototropic response - the bending of a plant organ toward (stems and leaves) or away from (roots) a directional blue light source. Phototropism is one of several photoresponses of plants that afford mechanisms to alter their growth and development to changes in light intensity, quality and direction.
